

The Federated Secure Cloud Solution

BAE SYSTEMS

Overview

BAE Systems and Dell EMC are now offering a federated secure cloud solution that provides federal agencies the ability to adopt a framework of standards for interoperability, information sharing, and Security in the Cloud. This hybrid cloud is available as an agile on-premises private cloud solution, or as a virtual private cloud via Amazon's C2S or Microsoft's Azure.

The secure environment lets users collaborate using common business applications with access to mission-essential tools. Its revolutionary, secure cloud architecture automates patching and updates, lessening the user and mission impact of regular IT maintenance and reducing local administration costs.

The cloud solution offers a building block architectural approach that is scalable and flexible to support a broad range of agency mission needs. Microsoft's Windows 10, Office 2016, and Asset Management come standard, with optional customizable offerings to include Microsoft Exchange, SharePoint, unified communications tools, and virtual application services. Agencies can choose a BAE Systems Operation and Maintenance contract or leverage their current staff with requisite training provided by BAE Systems technical experts. Desktop clients are available in multiple form factors from Dell EMC, or agencies can continue to leverage their current desktops.

FSC Benefits

- Scalable to both small mission critical teams as well as entire agencies at the enterprise level
- Deployable client solutions available to include thick, thin, or zero client
- Based on an authorized design for TS/SCI network environments while easily scalable to compartmentalized, secret, and unclassified networks
- Virtual desktop infrastructure options allow user access from any location within the organization, empowering workplace mobility
- Optional services like email, collaboration tools, unified communications, virtual applications, and many more are customizable to customer specifications
- Operation and maintenance are available through managed service options

Adoption

Flexibility in adoption is critical to providing a smooth user transition and aligning with agency budget realities. With customizable options, agencies can adopt a simple baseline today and add services later as needed, and as budgets allow. The federated secure cloud solution is available through multiple agency-preferred contracting vehicles.
